# Today's Agenda

**Decentralized (Virtual)  
Clinical Trials**

**Overview of The Learning  
Corp's Virtual Trial**

**Summary / Conclusion**

**Questions**

# Decentralized Clinical Trials:

*What are they?*

# Key Definitions

## Decentralized Clinical Trials (DCT), also known as Virtual Trials

DCTs are conducted in a study participant's home using digital tools. They offer a way to make better informed decisions about the efficacy of new therapies (Coravos, 2018)

## Contract Research Organizations (CRO)

An organization that is contracted by another company to manage and lead the company's trials, duties, and functions

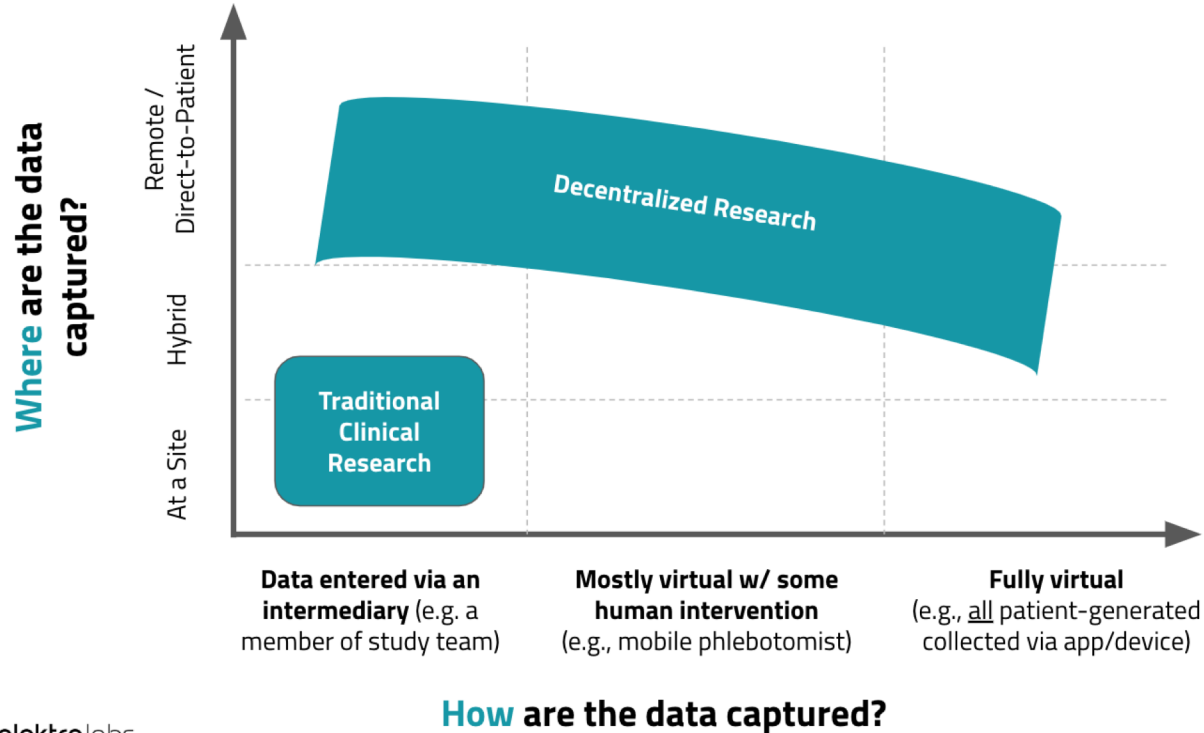

## Endpoints

An event or outcome that can be measured objectively to determine whether the intervention being studied is beneficial (NIH)

# Traditional, Mixed Model, and Decentralized Approaches...

Decentralized studies have two components: decreased reliance (1) on an intermediary and (2) on a physical location

(Coravos, 2018)

# History of Virtual Trials *(Dolgin, 2018)*

## Eli Lilly - 2001

- First major pharma-backed foray into internet-based trials
- Participants filled out online questionnaires and also completed in-person visits at clinical sites

The Lilly logo, featuring the word 'Lilly' in a red, cursive script font.

## Pfizer - 2011

- First truly virtual study
  - Web-based informed consent and data collection
- 2 Key Findings:
  - Marketing was a challenge, because it was decoupled from treating physicians
  - Rigid protocol did not put interests of the participants first

The Pfizer logo, featuring the word 'Pfizer' in white, sans-serif font inside a blue oval.

# Potential Concerns - *Data privacy*

“Online recruitment based on information acquired through non-transparent practices also threatens individuals privacy rights, the well-being of participants, the integrity of the trial process and ultimately the health of the public”

*(Dolgin, 2018)*

images)

(Getty

# Potential Concerns - *Reduction in MD/Specialist visits*

Industry will also have to allay fears that reduction in doctor's visits may jeopardize patient safety.

- Minimally anticipated risk
- Collective intelligence (used in tandem with SLP intervention)

# Decentralized Clinical Trials:

*Why do they matter  
and how can we  
maximize their  
potential?*

# Why should we innovate?

Virtual Trials have the potential to act as a medium platform to address the common issues that have faced traditional clinical trial approaches, such as:

- Patient Engagement
- Recruitment
- Retention
- Compliance

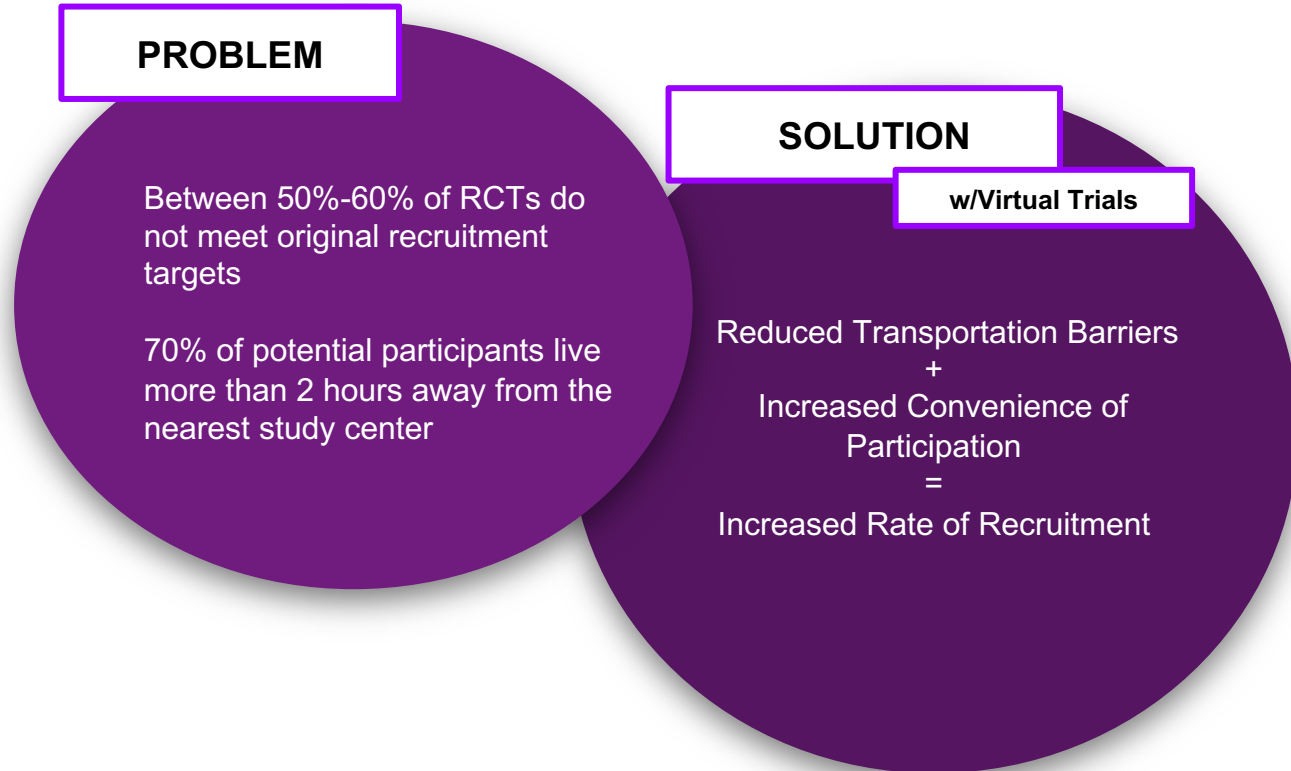

# Current Barriers in Traditional Clinical Trials

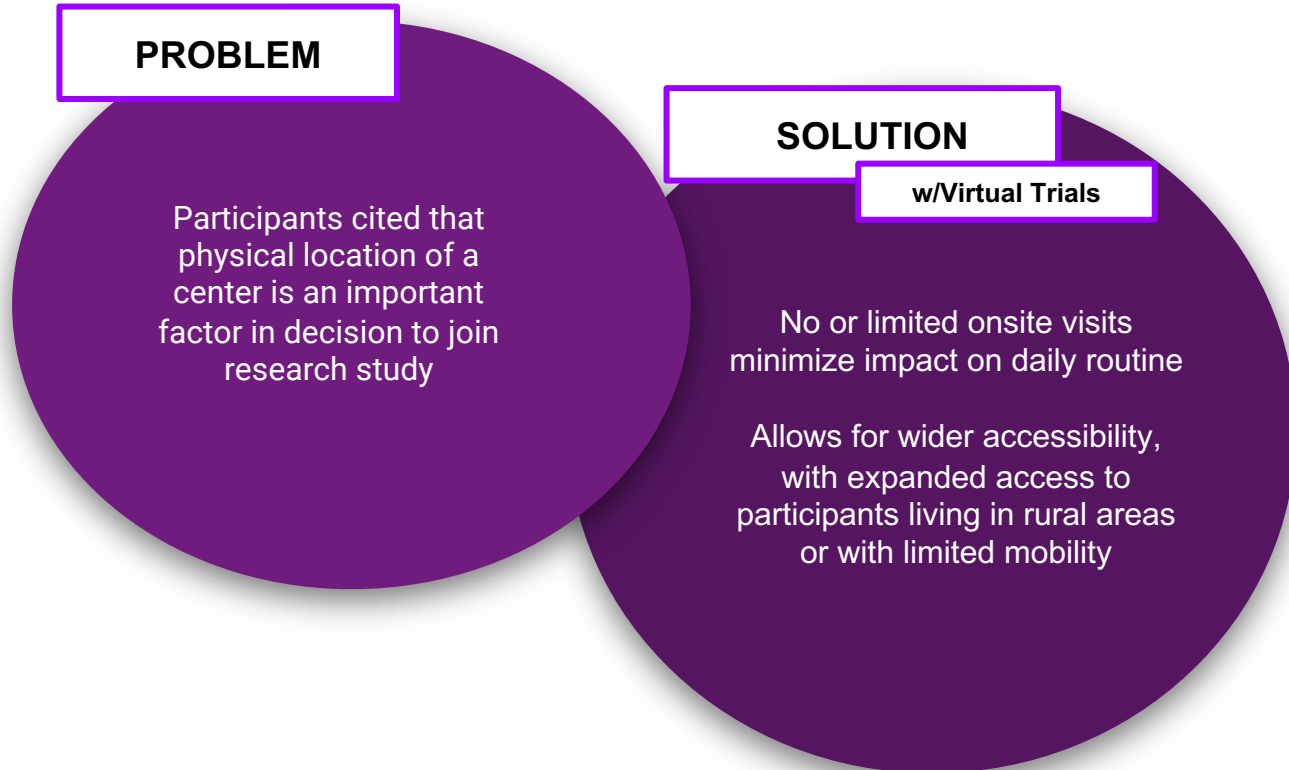

- 1 Recruitment
- 2 Geographic Location/Transportation
- 3 Lack of Patient Centricity

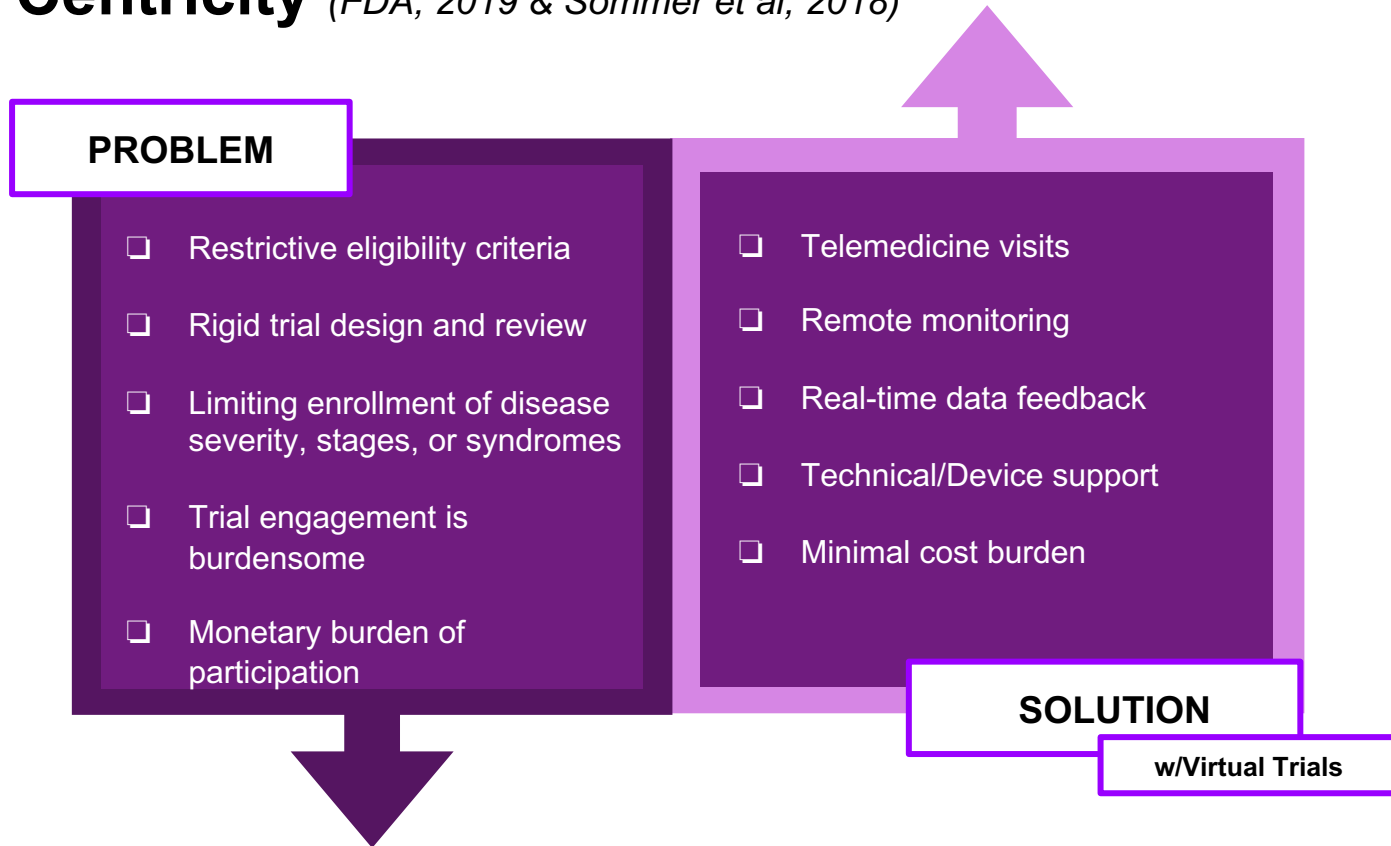

# Recruitment *(Sommer et al, 2018)*

# Geographic Barriers *(Sommer et al, 2018)*

# Patient Centricity *(FDA, 2019 & Sommer et al, 2018)*

# Decentralized Clinical Trials:

*New challenges  
facing virtual trials*

1

## Protocol Design & Review

- Adapting Inclusion/Exclusion Criteria
- Methods & Assessments
- Clinically Meaningful Endpoints

2

## Operational Logistics

- Capturing eConsent
- Technical Support with Device Usage
- Device Integrity
- Data Privacy

3

## Recruitment & Retention

- Multi-step Recruitment Strategy (Facebook ads, etc)
- Study Procedure Compliance
- Caregiver Support
- Time Commitment

The key takeaway is that logistically, the goal behind driving virtual trials for investigators and businesses won't alter, but **we can control how we can inspire people to participate in research on terms that are equitable for them and create patient centric platforms** that do deliver on their promise.

*(Dolgin, 2018)*

# Decentralized Clinical Trials:

*Tips for those  
involved in trial  
design*

1 Select a CRO with expertise

2 Be transparent with CRO and vice versa

3 Establish an internal clinical team

4 Engage vendors early on in development process

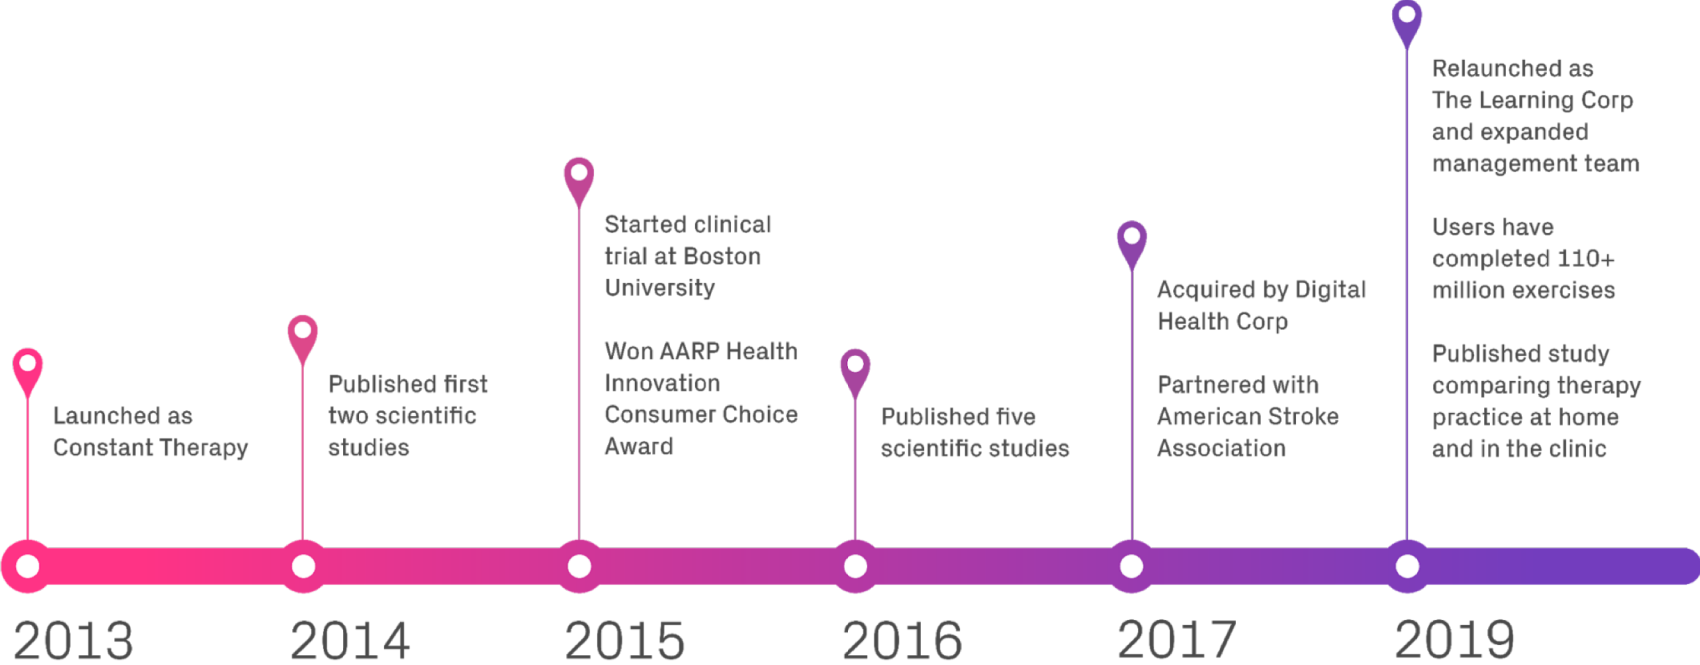

5 Outline your milestones and budget

# What is Constant Therapy?

# The Learning Corp: brain health, for life

# Who uses Constant Therapy?

**Patients** recovering from stroke and traumatic brain injury, or living with speech, language or cognitive disorders.

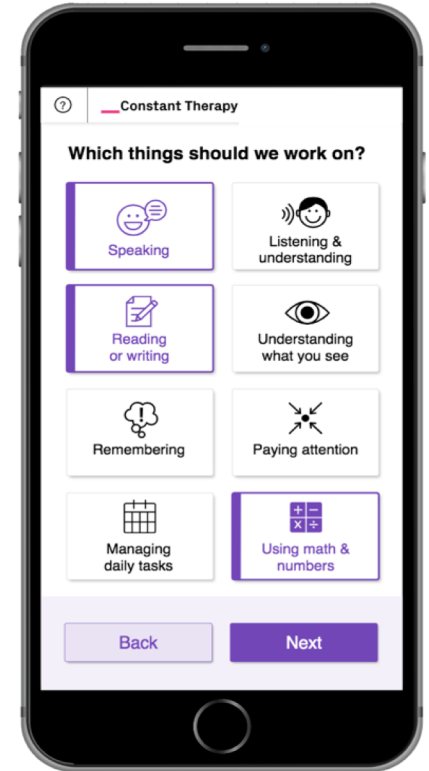

**Speech Language Pathologists (SLPs)**, professional caregivers and loved ones, who are helping these survivors rebuild every day skills like speech, language, cognition, memory, reading, attention and comprehension skills.

**The companies who serve them:** life sciences, payers/providers.

## Constant Therapy

- **Mobile app:** 24/7 access to clinically-proven exercises that you can be used anytime, anywhere.
- **Evidence-based practice library:** More than 14 categories, 80+ exercises with up to 12 levels of difficulty.
- **Personalized care:** Uses AI engine and data analytics to deliver a personalized exercise program tailored to user goals and abilities.

# NeuroPerformance Engine™ tailors the curriculum for each client

The foundation for our products, the patented NeuroPerformance Engine™, constantly monitors and analyzes client performance and progress.

It presents - and constantly adjusts - exercises based on clients' past performance data, and on the performance data of thousands of others with a similar condition.

Reports

You have practiced **2**  
**days** this week

Let's try for at least four  
days this week. You're  
partway there!

Accuracy

Just right

**Welcome back.**

Let's do  
some therapy.

Start

# The Learning Corp's First Virtual Trial

# GOAL: To Differentiate CT as a Digital Therapeutic

- There is a disparity between apps with research evidence and apps currently being used by consumers
- Despite emerge of curated app libraries for health apps (*Larsen et al, 2019*), personal searches based on app description remains the common method for discovering apps
- Why does this pose an issue?

Claims of effectiveness using scientific language might skew consumer's expectations of the therapy they are using

(Image from project Dialogue Report)

# A parallel, virtual, randomized trial of CT- Research for speech, language, and cognitive intervention in stroke patients

## Study Aims **Primary Aim:**

To evaluate the change in aphasia severity over time in experimental CT group vs a control group.

## **Secondary Aim:**

Assess the feasibility of a remote assessment procedure and adherence to treatment in an experimental CT and a control group.

# Study Design & Population

## Population

30 people with post-stroke aphasia who had had a stroke at least 4 months prior and who were no longer getting skilled 1:1 SLP intervention

## Study Design

Participants were recruited, screened, and assessed

After assessment, participants were placed into experimental or control group

Experimental: use of Constant Therapy app daily  
Control: completion of workbook pages daily

Bi-weekly check-ins to check performance

Post intervention remote assessment

# Overview of Inclusion / Exclusion Criteria

We included participants who had a history of one stroke that resulted in speech and language deficits.

We excluded participants who had a history of multiple strokes, who had a stroke that did not result in language impairment, and participants who were still participating in skilled 1:1 SLP intervention.

# Study on Virtual Speech Therapy

## Recruitment

Facebook ads, Google ads, advocacy outreach, rehab centers, clinicians, email, print collateral, website

## Initial assessment

User receives kit at home and completes a language assessment with a clinician via video conference

## Therapy

Therapy delivered via app to experimental group; clinician does biweekly virtual check-ins; ST is used for 20 weeks total

## Final assessment

Administered by clinician via videoconference

# Findings from The Learning Corp's decentralized trial

-  Recruitment
-  Scheduling and Communication
-  Patient Engagement and Compliance
-  Training of Technology
-  Supply Management (shipping, storage, etc)

# Summary

# Wrapping Up

	Decentralized trials have value	<ul style="list-style-type: none"><li>• Creates tailored protocol designs</li><li>• Maximizes engagement from all study participants</li></ul>
	DCTs have positive impact on recruitment	<ul style="list-style-type: none"><li>• Increases the rate of recruitment</li><li>• Reaches out to heterogeneous populations</li><li>• Widens access to rural populations</li></ul>
	DCTs reduce participation burden	<ul style="list-style-type: none"><li>• Incorporates telemedicine visits</li><li>• Allows remote monitoring/check-ins</li><li>• Minimizes burden of cost</li></ul>
	DCTs allow for real-time data collection	<ul style="list-style-type: none"><li>• Increases participant communication</li><li>• Allows for study adherence and compliance monitoring</li></ul>

***DCTs come with their own set of challenges, however, anticipating the road blocks is key to successful study design***
